LAB 06 – Team 3 Section 2

Phase 1 — FOCUS:

Relevant MVP capability / flow

The core Lab 05 flow: a student opens the centralized event listing, uses basic search/filtering to narrow it down, and opens an event to read its key details (date, time, location, purpose, activities) in order to decide whether to attend.

Selected uncertainty: What are you still unsure about?

We are unsure whether the event information shown in the MVP is enough for a student to decide on attending without leaving to check Outlook, social media, or friends. Our survey told us what students *say* they look for (date, time, location, type, purpose, benefits).

Why does this uncertainty matter for your MVP?

"Clear event information" is one of the three capabilities we kept in the MVP, and our value statement depends on it. We want students to find events worth their time in one centralised place. If the listing doesn't give them enough information to decide, they will go back to asking friends, checking social media, or searching online, which is the problem we started with. The MVP would then be no better than the Navigate360 events section that most surveyed students never use.

Learning Question

When students use our event listing to decide whether to attend an event, can they get enough information from the listing and detail page to make that decision, and what information do they look for or ask about that is not there?

Phase 2 — BUILD:

Campus Events

Events

Search events, clubs or places

Don't miss what's happening on campus

Workshops, competitions, talks, food and games from every college, all in one place.

Computing & IT · Engineering · Business · Health Sciences · University-wide

College

- All colleges 13
- Computing & IT 3

Thursday, 22 October

Time
1:00 – 2:30 pm

Location
Building 5, Lab 2.14

About this event

A hands-on session for students who have never used version control and need it for course projects.

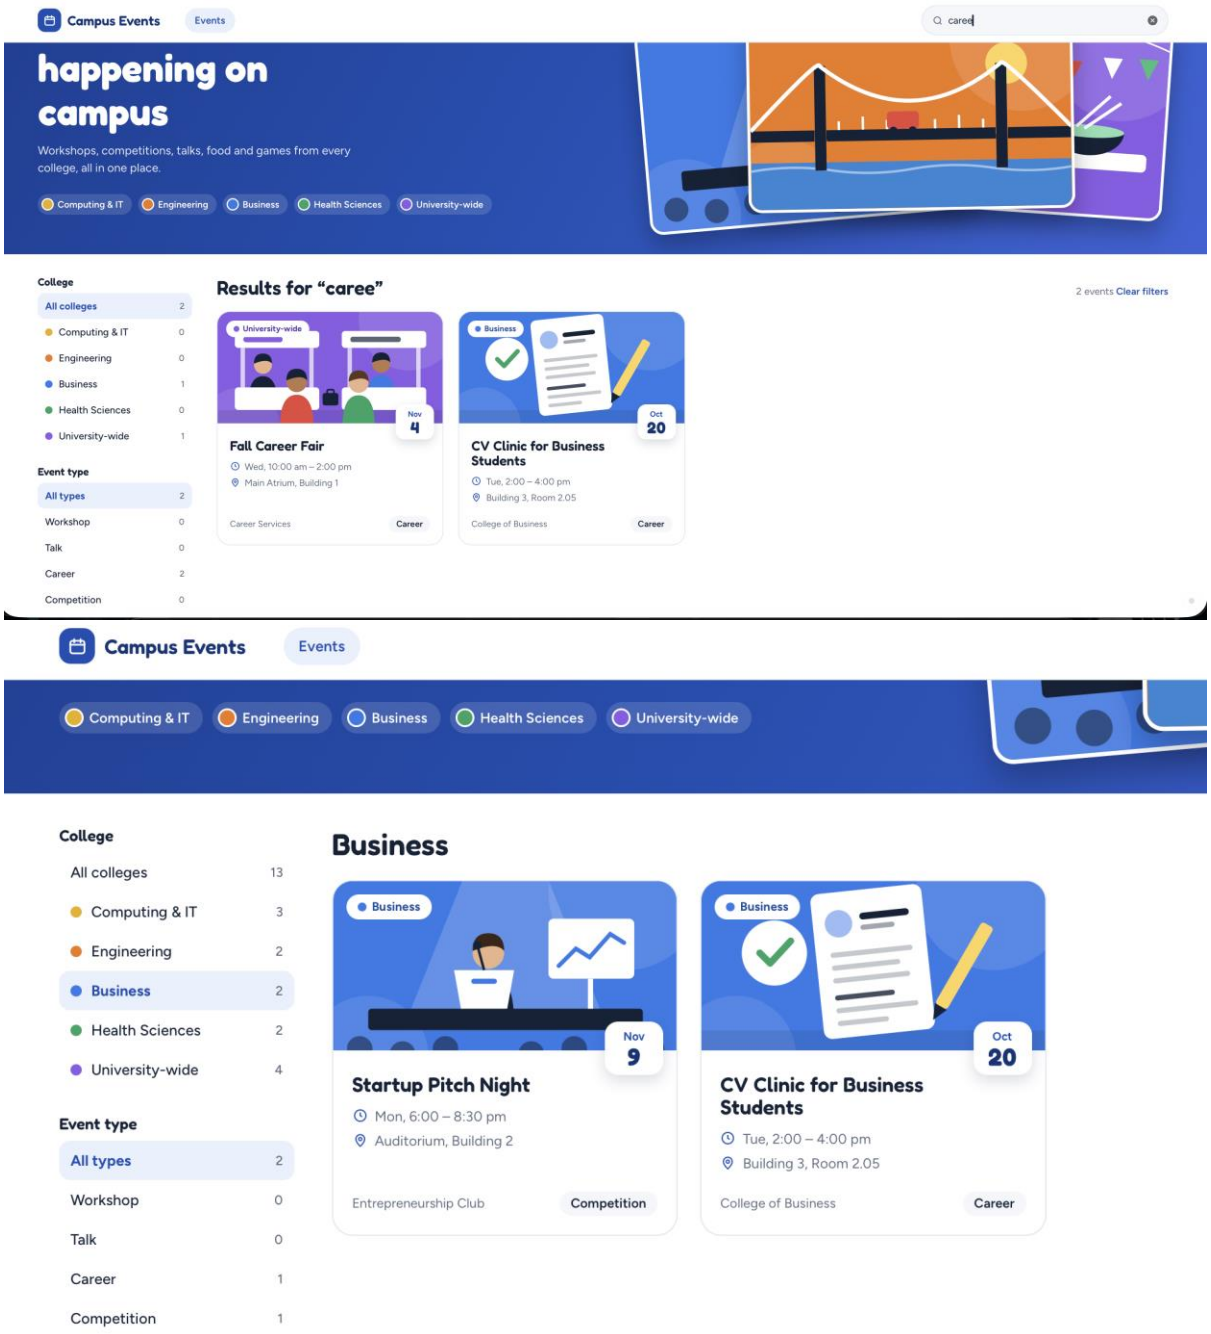

What you'll do

- Set up Git on your own laptop
- Create and clone a repository

Would you go to this event?

Pick the answer closest to what you'd really do.

- Yes, I'd go
- No, not for me
- I'd need to check somewhere else first

What must the participant be able to see, do, or experience?

The participant must be able to browse a page of upcoming campus events, search by keyword, and filter by college and event type. They must then open an event and read its key details: date, time, location, organizer, purpose, and activities. Using only that page, they decide whether they would attend. If the information isn't enough, they can say what's missing and where they would go to find it.

What will you deliberately NOT prototype today?

We are not prototyping accounts or login, organizer posting and approval, notifications or reminders, personalized recommendations, ratings or reviews, attendance counts, food or participation certificate tags, RSVP or registration, or soonest first ordering. The

missing information fields like food, certificate and registration are left out on purpose so we can see whether participants look for them.

Prototype choice	Your decision
Type	Coded clickable prototype (single-page website).
Fidelity	Realistic website layout with working search and filters, but no backend.
What will be faked or simulated?	The 13 events are fictional sample data stored in the page, with no real university data. College colour coding (yellow IT, orange Engineering, blue Business, green Health Sciences, purple university-wide) uses sample assignments. The “Would you go?” panel is a test instrument, not a planned feature. Responses are recorded only in a hidden facilitator log in the browser, not sent to a server.
Tool(s) / approach	AI-assisted coding (HTML, CSS, JavaScript), published as a shareable link and stored in GitHub under docs/lab06/prototype/.

Phase 3 — PEER TEST:

Situation + participant goal:

> Find an event worth your time and decide if you'd go, without asking anyone for help.

What do you want to observe in relation to your Learning Question:

Do you find the information within the details section enough?

Does the filter make it easier to find events?

What else would you like to know but can't find?

How easy it is to navigate the events?

Whether the participant reaches a clear "I'd go" or "I wouldn't" using only the platform, or says they would check Outlook, social media, or ask a friend.

Phase 3 — LEARN

#	What did you observe?	What might it mean?
1	Individuals would prefer more personalization	Students may want the platform to filter out irrelevant events for them. This partly

		supports our earlier Direction 3 (personalize discovery), which we rated Medium. Personalization may matter more than we assumed.
2	More events details within the detail page such as event capacity.	The detail page is missing information students use to decide. This challenges Key Assumption 2, since students could not fully decide from the listing alone. Capacity may be needed for the core value, not just a nice extra.
3	More consistent UI within the flow	Inconsistency may slow decisions and reduce trust in the platform. This is a usability issue rather than a missing feature, so it is probably a quick fix.
4	Remove the collages filter to a side as a drop down	Students do want to filter by college, but the current placement and format make it hard to use. The filter is worth keeping, and the fix is a redesign of its layout, not a new feature.

6. Phase 4 — REFINE & SUBMIT

Use what you learned to decide what should happen next. Separate the decision about the prototype from the next
learning action.

Decision about the prototype

REFINE

What will change, and why?

We will change the UI because according to the feedback the design was inconsistent. We will also try to make it more faculty-friendly by making the college filtering in a drop filter because faculty will not need to use it like students. Lastly, we will add some extra details including seats and external collaborators. Also, later we will add personalization as discussed.

Next learning action

TEST WITH REPRESENTATIVE USERS IY

Impact on the MVP

Refine something already IN

Why?

As mentioned before, we will refine existing features like filtering in a different way which will suit our target audience best.
